

# BIRD

Bioinformatics, Research & Data  
Bioinformatique, Recherche &  
Données

Practical bioinformatics, data analysis,  
training, and reproducible research  
workflow support for laboratories and  
life sciences teams.

# Bioinformatics support for your research team

From study design to reproducible analysis, data organization,  
workflow development, training and scientific mentorship.

## Free 30-minute initial consultation available for new projects.

Use this meeting to discuss your project goals, data type, timeline, current challenges and possible next steps. This free consultation is intended for general project orientation only.

Practical support for research teams working with biological data, from planning to analysis, documentation and training.

01

### Study Design & Bioinformatics Consultation

Planning support before data generation or analysis.

02

### Omics & Sequencing Data Analysis

Support for omics and sequencing data analysis.

03

### Pipelines, Data Organization & Troubleshooting

Support with computational workflows, reproducible project structure and technical bottlenecks.

04

### Training for Biologists & Research Teams

Personalized training for students and research team members.

05

### Mentorship, Documentation & Scientific Guidance

Technical guidance, code review, interpretation support and workflow handover.

## Why BIRD?

Senior bioinformatics support for research teams that need clear analysis, practical guidance, and reproducible workflows.

- 10+ years of experience in academic research environments
- Expertise in omics and sequencing analysis, research data management and HPC
- Practical training adapted to biologists and research teams
- Reproducible documentation and workflow handover

**Professional note:** Services are provided independently through BIRD and can be adapted to each laboratory's needs, budget, and timeline. Institutional logos, confidential information, or unpublished project details are not used without prior authorization.

# BIRD Services

Services are tailored to each project's scientific goals, data volume, and timeline. BIRD combines senior bioinformatics experience in academic research with practical support in omics and sequencing data analysis, training, research data management and reproducible workflow development.

## Core Service Areas

|                                                 |                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Study design consultation</b>                | Bioinformatics guidance at the planning stage, including sample and metadata structure, replicate strategy, comparison design and analysis strategy.                                                                                                                                                                                      |
| <b>Omics &amp; Sequencing Data Analysis</b>     | End-to-end support for omics and sequencing projects, including quality control, exploratory analysis, WGS, WES, RNA-seq, scRNA-seq, ChIP-seq, amplicon-seq, small RNA-seq, methyl-seq, ATAC-seq, PhIP-seq, metagenomics, metabarcoding and resistome analysis, with interpretation and preparation of clear figures, tables and reports. |
| <b>Pipeline development and troubleshooting</b> | Development, optimization and troubleshooting of Python, R and Bash workflows, with support for HPC and job-scheduler environments, including Slurm/Torque, automation and reproducible project structure.                                                                                                                                |
| <b>Research data management</b>                 | Support for organizing research data, metadata, documentation, access-controlled files and project structure to improve clarity, reproducibility and workflow handover.                                                                                                                                                                   |
| <b>Training and capacity building</b>           | Practical training in Python, R, Bash, bioinformatics fundamentals, sequencing basics, biological databases, file formats, research data organization, HPC and Alliance cluster basics, adapted to the learner's background and project needs.                                                                                            |
| <b>Mentorship and scientific guidance</b>       | Scientific and technical guidance for students, trainees and research teams, including project planning, code review, data interpretation, workflow documentation and knowledge transfer.                                                                                                                                                 |

## Service Formats

|                             |                                                                                                                                                              |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Hourly support</b>       | Focused support for troubleshooting, technical questions, code review, short-term project needs and practical bioinformatics guidance.                       |
| <b>One-on-one training</b>  | Personalized training adapted to the learner's project, background and skill level.                                                                          |
| <b>Fixed-price packages</b> | Structured support for defined analysis projects, workflow audits, study design consultations, documentation or training sessions.                           |
| <b>Customized workshops</b> | Practical workshops tailored to a team, course, research group or specific dataset.                                                                          |
| <b>Monthly lab support</b>  | Ongoing collaboration for teams that need regular bioinformatics guidance, troubleshooting, training and workflow continuity across their research projects. |
